1 When will all physicists publish in the ArXiv?

10.9.2003 Eberhard R. Hilf hilf@isn-oldenburg.de
Version 0.1 Comments are welcome and will be included. Copyright: Spreading this note is welcome giving the link to the actual version http://www.isn-oldenburg.de/ hilf/

Here are some more elaborate but rather audacious risky estimates to support the theses (P.Ginsparg would know better). The ArXiv is unique in that it serves the usage and submission log files.

At present (after 146 months of service) there are 246.555 documents stored. The monthly rate of incoming new documents are at present 3.500. It rises linearly with time, see $\dot{D}t$. Next month there will be 24 papers more per month handed in than this month.

This allows to integrate it to get an estimate, at which future time virtually all physicists would send in their prime papers to the ArXiv.

Let us estimate the number of physicists worldwide to be 10^6 of which 10 % might be active as researchers, producing, say 2 papers per year. Then we have 200.000 prime physics papers per year. ¡integrating this yields to see them all in ArXiv to be in 44 years and six months from now, that is in the year 2050.

Clearly, by then we will have passed more technical revolutions, so that this steady state extrapolation is not likely to happen.

Other new developments may have a much steeper rise of spreading, notably the selfarchiving by the authors, their institutes or Universities and their libraries forming a distributed net of repositories.

The advantage is its scalability, flexibility, the business model (distributed funding by the institutions of the creators of the documents), the retaining of the author's rights, the update possibility, and the acceptance spreading: to convince a large body such as a learned community to set up a central service such as the ArXiv for physics is much harder, then to convince a percentage of local distributed institutions and institutes (the *multiple small versus one large barrier chance*).

The challenges are to set up the needed international standards, to allow intelligent search engines to serve the retrieval, to stimulate the discussion and communication between the authors, -known in the past of beeing very conservative but not considerate of their working habits, and not very colloquial about it, used that they are being taken care of and that someone else pays..

At present, the ArXiv is still unique in serving unconditional time stamp, and long term readability.

2 Is the usage is proportional to the size of a repository?

Reachout to and satisfaction of users of a repository may be estimated by the ratio of pageviews per month divided by the number of documents, see table. This ratio is aston-

repository	Q	D	Q/D
MareNet	1.595	3.000	1.9
MPIV	3.027	10.813	3.57
PhysNet	5.759	24.000	4.2
VAB	2655	27.500	10.4
ArXiv	245.056	410^6	16.3

Number of Page views per month Q per documents contained D may be used as hinch for the acceptance.
